

AI infrastructure, built in phases

Mead, Oklahoma

A development-stage investment in GPU compute
and a behind-the-meter power strategy.

INVESTOR PRESENTATION / SEPTEMBER 2026

AI CONCEPT ARTWORK / NOT CURRENT SITE PHOTOGRAPHY

The SmartTec investment case

39.39

acre legal parcel in Mead, Oklahoma

SmartTec.dev LLC operates under SmartTec Holdings LLC. Z1Power provides the parent battery-company context.

A focused compute opportunity

Dedicated GPU services with procurement sized to customer commitments. The current financial study favors B300 over RTX at management's supplied prices.

Power economics

Management reports a solar, battery and gas supply agreement below 7 cents/kWh. Firm capacity and full cost coverage remain under review.

Development-stage discussion. Owner reports underpin property, organization and power statements. Signed customer demand is unverified.

Power demand creates a large backdrop

Global data-center electricity use

Local revenue depends on execution

The IEA's 2026 outlook projects roughly twice the global data-center electricity use by 2030.

SmartTec must turn its own available power, commissioned infrastructure and workload performance into paying customer contracts.

TWh / year

Source: IEA, Key Questions on Energy and AI (2026), executive summary. Global demand does not establish SmartTec bookings or market share.

The Mead campus

5,035

sq ft gross data-center building area

Building A: 1,500 sq ft

Building C: 3,535 sq ft

Building B adds 2,083 sq ft for batteries, utilities and storage. Gross building area does not establish IT capacity.

8460 US 70, Mead, OK 73449

The campus concept separates existing compute structures from proposed manufacturing and energy development.

Two proposed 30,000 sq ft factories address inverter manufacturing and battery assembly. Solar and storage remain separate development scopes.

Owner record, 10 Sep 2026. Legal acreage: 39.39. Legacy survey tract annotations total 39.21 acres. Title, rights and permitted use require diligence.

Behind-the-meter power strategy

<7¢

per kWh, reported by management

Management reports a supply agreement using solar, batteries and gas generators.

The model uses 7¢/kWh. The team is confirming continuous reserved kW, service date and fuel, maintenance and equipment obligations.

Energy input is conditional, not a verified all-in tariff. Shared O&M; service is recorded separately. Image: SmartTec AI concept artwork.

Engineering defines usable capacity

SYSTEM	CURRENT BASIS	REQUIRED ACCEPTANCE
Electrical	3,000 A / 208 V / three-phase owner-reported shared service	Usable exclusive kW, voltage conversion, protection and commissioning
Cooling	Two-loop design concept	Final OEM loads, heat rejection, controls and commissioning tests
Connectivity	Dobson fiber target 8 Oct - 5 Nov 2026	Installed service, measured throughput and actual carrier terms
Resilience	Four spare GPUs in the 64-GPU case	Node failure, network failure, power transfers and recovery procedures

Planning records and engineering allowances. Four GPUs do not replace a complete eight-GPU node. No uptime certification or approved site capacity is claimed.

B300 leads at the supplied prices

OWNER INPUT	B300	RTX 6000
GPU-hour rate	\$6.50	\$1.50
Eight-GPU system	\$670,000	\$170,000
Per-GPU allocation	\$83,750	\$21,250

B300 suits the primary owned-compute study. RTX needs a workload and pricing case that justifies its investment.

Owner inputs, 10 Sep 2026. Exact OEM scope and support remain unverified. RTX context: PRO 6000 Blackwell Server Edition. Image is conceptual.

Customer commitments precede procurement

Proposed customers

AI application companies and GPU-cloud operators that need dedicated compute. Workload fit, security needs and support scope determine the actual offer.

Proposed contract structure

Minimum paid GPU-hours, collection security and defined service credits. Model paid usage separately from hardware availability and utilization.

Qualification evidence

Paid pilot results, signed minimum payments, credit review, support costs and renewal terms. No contracted customer pipeline is represented in this deck.

Commercial strategy is proposed. The 18-20 paid hours/day assumptions do not represent existing bookings, contracts or guaranteed demand.

A conditional 60 + 4 B300 deployment

8

eight-GPU systems

60

saleable GPUs

4

reserve GPUs

\$5.36m hardware purchase

All 64 GPUs carry purchase and power costs.
Revenue comes from the 60 saleable GPUs.

159.6 kW modeled IT peak

Includes supporting IT. PUE is 1.4 for energy modeling. Engineering must establish deliverable facility capacity.

This is a financial alternative, not an ordered fleet. The earlier two-RTX/one-B300 concept remains separate. Reserve GPUs are not full-node redundancy.

Monthly cash generation can be positive

NORMALIZED 30-DAY OPERATING MONTH

USD

60 GPUs x 20 paid hours x \$6.50 x 30 days

\$234,000

Receipts after 98% collection and 10% fees

\$206,388

Electricity at 7¢/kWh and PUE 1.4

\$8,538

Other operations, network and demand costs

\$35,427

Operating cash before capital spending

\$162,423

Illustrative early operating month. Operating cash excludes equipment/site acquisition, overhaul, tax and investor distributions. Calendar-month results vary.

Capital covers more than GPUs

\$6.84m

initial modeled funding

Plus approximately \$106,584 in later capital calls.

The final raise depends on full quotes, customer terms, engineering and the agreed investor structure.

INITIAL USE	USD
Eight B300 systems	\$5,360,000
Site work and contingency	\$652,800
Startup and acquisition allowance	\$566,000
Opening operating reserve	\$264,501

Five-year cash model

USD THOUSANDS	YEAR 1	YEAR 2	YEAR 3	YEAR 4	YEAR 5
Gross billings	2,129	2,855	2,847	2,847	2,847
Collected receipts, net of fees	1,878	2,518	2,511	2,511	2,511
Operating expenses	503	545	561	578	595
Operating cash	1,375	1,973	1,950	1,933	1,916
Later capital spending	0	0	0	536	0
Net distributions less calls	1,375	1,973	1,950	1,397	2,140

Five-year net cash profit: \$1.99m Total five-year ROI: 28.7%

Year 1: Oct 2026-Sep 2027, with sales from Jan 2027. Initial funding excluded from table. Year 4 includes overhaul. Year 5 releases reserve after exit costs.

Fleet size does not guarantee a strong return

B300 FLEET / 20 PAID HOURS	TOTAL FUNDING	5-YR PROFIT	NPV AT 15%
24 / no reserve	\$2.77m	\$0.17m	-\$0.73m
60 + 4 reserve	\$6.95m	\$1.99m	-\$0.67m
72 / no reserve	\$7.77m	\$3.31m	\$7,361

72 GPUs barely meet the assumed annual hurdle.

Its positive NPV is less than 0.1% of total funding and fails the tested downside cases.

912 configurations: 8-128 GPUs, B300/RTX/mixes, reserve variants and 18/20 paid hours. At 18 hours, none passes. Total ROI and annual discount rate differ.

Price and procurement terms change the result

\$7.03 / GPU-hour

At \$670,000 per eight-GPU B300 system, the 60 + 4 case reaches the 15% hurdle at approximately this flat rental price.

\$604,000 / system

At \$6.50 per GPU-hour, approximately this eight-GPU B300 purchase price reaches the same hurdle, with hardware-linked costs recalculated.

A smaller 24-GPU option

At 20 paid hours/day, approximately \$7.93/hour meets the hurdle with no reserve. At \$6.50/hour, total five-year ROI is about 6%.

Alternative sensitivities, not agreed prices. All cases assume 20 paid hours/day after month 3. Thresholds leave little cushion and need stronger contracted terms.

Downside resilience remains the decision gate

60 + 4 B300 CASE

NPV AT 15%

20 paid hours/day, flat \$6.50 pricing	-\$0.67m
--	----------

18 paid hours/day, flat pricing	-\$1.51m
---------------------------------	----------

20 hours, 10% annual rental-price decline	-\$1.93m
---	----------

20 hours, another \$10,000/month operating cost	-\$1.15m
---	----------

20 hours, full hardware replacement in month 37	-\$3.81m
---	----------

One change at a time. Replacement stress substitutes 100% of original GPU-system cost for the 10% overhaul. No efficiency gain, resale or extra revenue assumed.

Execution milestones

MILESTONE	CURRENT TARGET / REQUIREMENT	CAPITAL RELEASE EVIDENCE
Construction start	24 September 2026 owner target	Defined scope and approved contractor budget
Transformer commissioning	8 October 2026 owner target	Electrical acceptance and exclusive capacity
Dobson fiber delivery	8 October - 5 November 2026 target	Carrier acceptance and performance tests
Compute commissioning	After power, cooling and network acceptance	Workload validation and support readiness
Revenue and expansion	Model sales begin January 2027	Paid commitments and collected receipts

Targets reflect the 10 Sep 2026 owner record and are not completion claims. The financial start date is an assumption, distinct from utility and carrier targets.

Names and roles supplied by management. No independently verified track records or biographies are represented.

A proposed investment framework

Funding scope

The 60 + 4 illustration requires \$6.84m initially and about \$6.95m including later modeled calls. Final raise size, valuation and ownership terms remain open.

Proposed investor controls

Release capital against signed procurement and commissioning milestones. Report cash collections, paid hours, downtime, operating costs and reserve coverage monthly.

Property and related-party rights

The owner reports \$2m gross property value. Title, debt, valuation and rights held by the investment entity require review. No collateral value enters GPU returns.

Governance proposals require agreement and documentation. The model has no debt and no negotiated investor waterfall, preferred return or tax treatment.

Expansion follows demonstrated demand

Compute first

Validate a paid workload and establish reliable service. Choose an initial fleet supported by complete costs and enforceable minimum payments.

Manufacturing and energy development

Proposed inverter manufacturing, battery assembly, solar and storage each need their own budget and approval.

Customer-owned hosting remains an alternative for separate review. No hosting leases or revenue are assumed.

No manufacturing, electricity resale, land appreciation or speculative terminal valuation supports the GPU return model.

Development areas are concepts. The reported power agreement does not establish SmartTec ownership of generation assets or a budget for their construction.

Investment risks and information limits

EXPOSURE	EVIDENCE NEEDED BEFORE INVESTMENT
Demand and rental pricing	Paid commitments, credit quality, renewal economics and service-credit limits
Power and engineering	Executed supply terms, continuous kW, cost inclusions and commissioned systems
Equipment and operations	Complete OEM quotes, useful life, support, staffing, security and software costs
Property and governance	Title, debt, permits, related-party rights, cap table and investor documents
Financial evidence	Company financial statements and actual operating records for diligence

Discussion material, not definitive offering terms. Projections are conditional and capital is at risk. This deck contains no audited SmartTec financial statements.

Financial assumptions

Revenue and equipment

60 saleable B300 GPUs plus four reserves. Eight systems at \$670,000 each. \$6.50/GPU-hour, 20 paid hours/day after month 3, flat pricing, 98% collection and 10% selling fees. All equipment purchased upfront.

Cash timing and return

Five years from October 2026. Six-month opening operating reserve. \$536,000 overhaul in month 37. \$40,000 exit cost and zero resale. Costs escalate 3% annually. No debt, tax effects or agreed distribution waterfall.

15% annual discount hurdle

NPV discounts project cash flows at 15% annually. Total ROI = (total distributions - total contributions) / total contributions, across five years. IRR is omitted for potentially ambiguous cash flows.

Source: SmartTec owner-deployment model and monthly ROI engine. These are planning assumptions, not verified costs, contracted utilization or guaranteed returns.

Operating-cost assumptions and sources

Operating-cost basis

\$23,200/month fixed operating allowance

\$8,075/month network allowance

\$4,152/month demand allowance

7¢/kWh energy and PUE 1.4

B300 node planning load: 19.7 kW peak and 15 kW average. Supporting IT adds 2 kW peak and 1 kW average.
